ACCOMPANYING YOUR CHILD TO THE OPERATING ROOM

The Hasbro Children's Hospital surgical suite provides a family-oriented environment in which the emotional stress associated with surgery can be reduced in a variety of ways. The orientation begins with participation at our preoperative program and familiarization for both child and parent with procedures that will be followed on the day of surgery.

The emotional effects of anesthesia induction are very age dependent. Younger infants separate from parents easily and are generally accepting of the face mask used to induce anesthesia. Parental anxiety is high, and it is recommended that parents of young infants *not* enter the operating room, so that operating room staff might concentrate efforts *solely* on the safety of the child. Once stranger anxiety occurs, children may be comforted by the presence of a parent, although they are extremely sensitive to parental anxiety and may become *more* upset by the presence of a nervous parent. Only one parent is permitted in the operating room, so it may be beneficial to decide ahead of times which parent will be more comfortable in this environment. If you can maintain a positive attitude, it will help your child to be more confident. Some children become acutely anxious at the last moment; try to be firm and reassuring, keeping in mind that operating room professionals are trained to handle children's anxiety. In some cases, preoperative sedation (usually a liquid) may be utilized to help relax your child before induction. If you believe this is appropriate for your child, please take the opportunity to discuss this option with your anesthesiologist.

Accompanying a child into the operating room can be very helpful for some families and anxiety-provoking to others. It can be most beneficial for young children from the age of 10 months on, and up to the early preteen years. We ask that you continue the conversation with your anesthesia team on the morning of your child's procedure, to discuss your concerns and expectations. We will individualize the treatment of each patient and their family with the utmost care and consideration.

IF YOU PLAN TO ACCOMPANY YOUR CHILD INTO THE OPERATING ROOM, PLEASE READ THE FOLLOWING CAREFULLY:

The onset of general anesthesia involves complete loss of consciousness, limp appearance, unfocused (glassy) eyes, and the potential for disturbances in breathing and heart function. A period of excitement and restlessness may occur. Anxiety reactions occur in some patients. For your safety, pregnant women should *not* enter the operating room.

In order to ensure maximum safety for your child, it is important to immediately respond to *any* directive from Anesthesia or Nursing staff while in the operating suite.
